E-mail enquiries: c22g@sanger.ac.uk Manuscript Sanger Institute name: pGEM-NK29F11.1
Homo sapiens cDNA sequence. This sequence was generated as part of The Wellcome Trust Sanger Institute program to isolate cDNA clones representing the full length open reading frame of well annotated protein coding genes on human chromosome 22. For more information see http://www.sanger.ac.uk/HGP/Chr22/.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CR456404.1 GI:47678338

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ECORI-NOII cut cDNA was then ligated into the vector. Vector. opluescript II KS(+); Site_I: ECORI; Site_2: NotI Host: Escherichia coli DH10B.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   735
                                                               The invention relates to a human sphingosine kinase-like protein. The polypeptide can be expressed by standard recombinant methodology. The sphingosine kinase-like protein and gene can be used to regulate intracellular signalling and consequently cell proliferation and apoptosis. Such regulation is useful for treating cancer, allergies (e.g. asthma), autoimmune diseases (e.g rheumatoid arthritis) and central and peripheral nervous system disorders (e.g. Parkinson's disease). The present sequence represents the human sphingosine kinase-like protein encoding cDNA
              system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TGCGCCGTGAGCCTGGAGCCCGCGCGCGCGCTCTGCTGCTGGTGGTGGCGGAGCCCGGGGGCCC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel isolated, enriched or purified nucleic acid molecule that encodes a kinase polypeptide. Specifically, it relates to human tyrosine and serine/threnoine protein kinases (FTK's and STK's), as well as protein kinase-like enzymes. The present invention describes screening methods to identify agonists, antagonists and antibodies that can be used to modulate the activity or function of the mammalian kinase enzymes. As such, these compositions can be used for gene therapy purposes to treat diseases or disorders including cancer, immune-related diseases, cardiovascular disease, brain or neuronal associated disease, metabolic and inflammatory disorders. Accordingly, they exhibit cytostatic, neuroprotective, immunomodulator and antiinflammatory activities. This polynucleotide sequence is a human kinase DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          151

thuman polypeptide. The protein encoded by the nucleic acid of the invention is useful for treating central and peripheral nervous system diseases (e.g. peripheral neuropathy, Huntington's disease, amyotrophic lateral sclerosis); neurodegenerative diseases (e.g. Parkinson's disease, Alzheimer's disease); autoimmune disease (e.g. Parkinson's disease, c.g. harbieimer's disease); autoimmune disease (e.g. systemic lupus crythematosus, rheumatoid arthritis, insulin-dependent diabetes mellitus); c.g. myeloid or lymphoid cell disorders (e.g. osteoporosis, wounds, ulcers, burns; bone disorders (e.g. osteoporosis); wounds, ulcers, burns; bone disorders (e.g. osteoporosis); c.g. osteoarthritis); mechanical and traumatic disorders (e.g. stroke, head crauma); lung or liver fibrosis; reperfusion injury in various tissues; c.g. bacterial, viral or fungal infections allergic conditions such as allergic rhinitis, asthma; coagulation disorders (e.g. haemophilia); cancer and tunmours; and inflammatory diseases (e.g. septic shock, Crohn's disease, anaphylaxis). The protein may be used to inhibit the growth, infection or function of infections agents such as bacteria, fungi, viruses, or to effect bodily characteristics, biorhythms or circadian cycles of rhythms. The protein may also have cycles of rhythms. The protein may also have cycles of rhythms. The protein may also have cycles of the invention are useful for expressing crecombinant protein for analysis. The present sequence represents a novel for manny for this sequence represents a novel for manny for the companion of the invention, this sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1443
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1623
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1743

The present invention describes an isolated PRO nucleic acid (1). Also described: (1) a vector comprising (1); (2) a host cell comprising the vector of (1); (3) a process for producing a PRO polypeptides; (4) an isolated PRO polypeptides; (4) an cisolated PRO polypeptide; (5) a chimeric molecule comprising the cisolated PRO polypeptide; (5) a chimeric molecule comprising the composition of matter comprising a polypeptide of (4); an agonist or antagonist of the polypeptide or an antibody that binds to the composition of matter comprising a container, a label on the container and a composition of matter of (7); (9) a method of treating an immune related disease in a comprising a container, a label on the container and a composition of mammal; (10) a method of treating an immune related disease or an inflamman related disease or an inflamman related disease or an inflammatory immune response or an inflammatory immune related disease or an inflammatory immune response or an inflammatory immune related disease or an inflammatory immune response or an inflammatory immune related disease or an inflammatory immune response in a mammal. The method of stimulating the immune response in a mammal. The properties of antialtery of or expression of a gene encoding a propertie, antithyroid, CNS, dermatological, gastrointestinal, antithyroid, canting an encoding and method or immune related disease or an inflammatory, vasotropic and virucide activities, and can be used in gene therapy. The nucleic acid or in the encoded polypeptides, compositions, and method encoded polypeptides, compositions, and methods are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New PRO polynucleotides and polypeptides, useful in useful in diagnosing and treating an immune related disease, e.g. systemic lupus erythematosus, rheumatoid arthritis, diabetes mellitus or asthma and in stimulating an immune response.
                                                                                                  human; PRO; immune related disease; inflammatory immune response; immune response stimulation; antiallergic; antianaemic; antiarthritic; antiasthmatic; antidiabetic; antiinflammatory; antipsoriatic; antithyroid; CNS; dermatological; gastrointestinal; haemostatic; hepatotropic; immunostimulant; immunosuppressive; muscular; nephrotropic; neuroprotective; osteopathic; respiratory; vasotropic;

obesity, New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, cancer or dyslipidemia, and in chromosome mapping, tissue typing

Claim 20; Page 134; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically comprising the above vector; (6) an antibody that immunospecifically comprising the above vector; (6) an antibody that immunospecifically comprising the above vector; (6) an antibody that immunospecifically compression to the presence or amount of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of screening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for modulating or the activity of the polypeptide described above; (13) methods of treating or mammal; and (14) a method for producing the above polypeptide in a mammal; and mammal; and can be used in gene therapy. The colypeptide is useful in manufacturing a medicament for treating a colypeptide is useful in manufacturing a medicament for treating a colypeptide associated with a human disease. The polypeptide or aciditated with a human disease. The polypeptide or acid and antilibration associated with a human disease. The polypeptide or acid and antilibration and antilibration and antilibration and antilibration and antilibration and antilibration and antilibration and antilibration and antilibration and antilibration and antilibration and anti acid molecule may be used to diagnose, treat or prevent metabolic disorders such as diabetes or obesity, infections, cachexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoletic disorders and various dyslipidaemias. The nucleic acids can also be used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and

ខូខូន	pharmacogenomics. The present sequence encodes a human NOVX protein from the present invention.

This sequence represents cDNA encoding a human ceramide kinase designated hCERKI. The invention relates to hCERKI, nucleic acids encoding it, expression vectors and host cells containing hCERKI nucleic acids, the recombinant production of hCERKI and antibodies specific for hCERKI. The invention also encompasses methods of isolating hCERKI from samples, the use of hCERKI in drug screening, and the use of hCERKI nucleic acid sequences in gene therapy. hCERKI mediates the ATP-dependent 1-phosphorylation of ceramides and can be used to screen for therapeutic and preventive agents for a wide range of disorders. Such disorders

Human ceramide kinase gene and the enzyme encoded by it for screening substances as drugs for neurological, inflammatory and other disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is that of an isolated polynucleotide encoding human sphingosine kinase C (SKC, see AAY96059), an enzyme that phosphorylates sphingosine to form sphingosine 1-phosphate. The polynucleotide was isolated from an Hela cDNA library by PCR amplification. The invention provides polynucleotides (see AAA50508-10) and polypeptides (see AAY96057
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New human sphingosine kinase A, B and C polynucleotides and polypeptides useful in e.g. chromosome and gene mapping, and detecting inflammation or disease associated with abnormal levels of sphingosine kinase expression.

The polymucleotides may be used as hybridization probes, in the construction of PCR primers for chromosome and gene mapping, in the recombinant production of SKA, SKB and SKC, and in the generation of SKA, SKB and SKC, and in the generation of antisense DNA or RNA. They can be used to detect inflammation or disease associated with abnormal levels of SK expression, or to detect differences in gene sequence between normal and carrier or affected individuals. Host calls expressing SK can be used in drug screening. Human SK specific antibodies, inhibitors, ligands or their analogues are useful as bioactive agents to treat inflammation or disease including viral, bacterial or fungal infections, allegic responses, mechanical injury associated with trauma, hereditary diseases, lymphoma or

The present invention relates to sphingosine kinase (SphK) polypeptides and nucleic acids encoding them. SphK is useful for treating a SphK-associated disorder especially cancers such as leukaemia, 1ymphoma, ovarian, breast, lung, colon, testicular, stomach and skin, atherosclerosis, restenosis or ischaemia and cell proliferative disease to disorder associated with vascular diseases. SphK gene is used in gene therapy and antisense-therapy. Sphingolipids serving as signalling molecules, have recently emerged as regulators of cell growth, diverse cell phencyppes and cell death. Activation of SphK by tumour necrosis factor (TMF) alpha inhibits apoptosis in human endochleial cells. The present sequence is human sphingosine kinase
                                                                                                                                                                                                                                                                            An isolated Sphingosine kinase polypeptide useful for treating a SphK-associated disorder especially cancer, restenosis or ischemia in a human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            241 ATGCTGGAGAAGCTGACGTCCAGACCAAAGCATTTACTGGTATTTATCAACCCGTTTGGA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is the coding sequence for human sphingosine kinase of 45PHK4). The kinase can be used for the diagnosis and treatment of sphingosine related disorders. The kinase can also be potentially used for controlling toxicity of platelet transfusion and as a platelet
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              GGAAAAGGACAAGGGAAGCGGATATATGAAAGAAAGTGGCACCACTGTTCACCTTAGCC

```
The invention relates to a novel isolated polynucleotide and the encoded polypeptide. The molecules of the invention demonstrate antinflammatory, neuroprotective, antianaemic, cytostatic and vulnerary activities and may be useful in preparing a composition for diagnosing or treating inflammatory, haematopoletic, immune, neurodegenerative or stem cell disorders, such as aplastic anaemia or cancer, as well as for promoting wound healing. The molecules may also be utilised during gene therapy procedures. The current sequence is that of a human therapeutic DNA of the invention. The current sequence is not shown explicitly within the specification but can be accessed from the WIPO web-site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful in seutibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging convolving aberrant protein expression of biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and anino acid sequences. Assets of the represent novel human diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              coding sequences of the invention. Note: The sequence data for this parent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at
